The Commission should perform an investigation into FM translators that rebroadcast programming of (mostly) full-power AM and FM stations in the country. I have found stations, such as W254CK licensed to Nashville, Tennessee, and W210CD in Hendersonville, Tennessee, to be interfering with other full-power stations nearby. In several areas, I can hear WHOP-FM Hopkinsville, KY, sometimes on top of W254CK. For W210CD, an unknown station likely in Kentucky causes interference on the frequency in the Shackle Island area of Hendersonville, Tennessee. I would encourage the commission to take a strong look at FM translators, especially those that operate in big towns such as Nashville, New York City, Los Angeles, Memphis, and other large cities, to see if other stations close by on the same frequency can be picked up. If so, the FM translators should be forced to move or cease operations, as it is more important for these full-power stations not to be interfered with. To be clear, I do believe small-town FM translators are important, as most relay signals from AM counterparts and relay vital community programming. I specifically want operations in large cities to be looked at to see what can be done to declutter these bands.
